

arquitetura baseada em **BFF** (**Backend for Frontend**)

*exemplo em **Next.js***

Isaac Gomes

o que é **Backend for Frontend** ???

Backend for Frontend (BFF) é um padrão de arquitetura usado para melhorar a eficiência e a experiência do usuário em aplicativos Front-end.

Isaac Gomes

para que serve **Backend for Frontend** ???

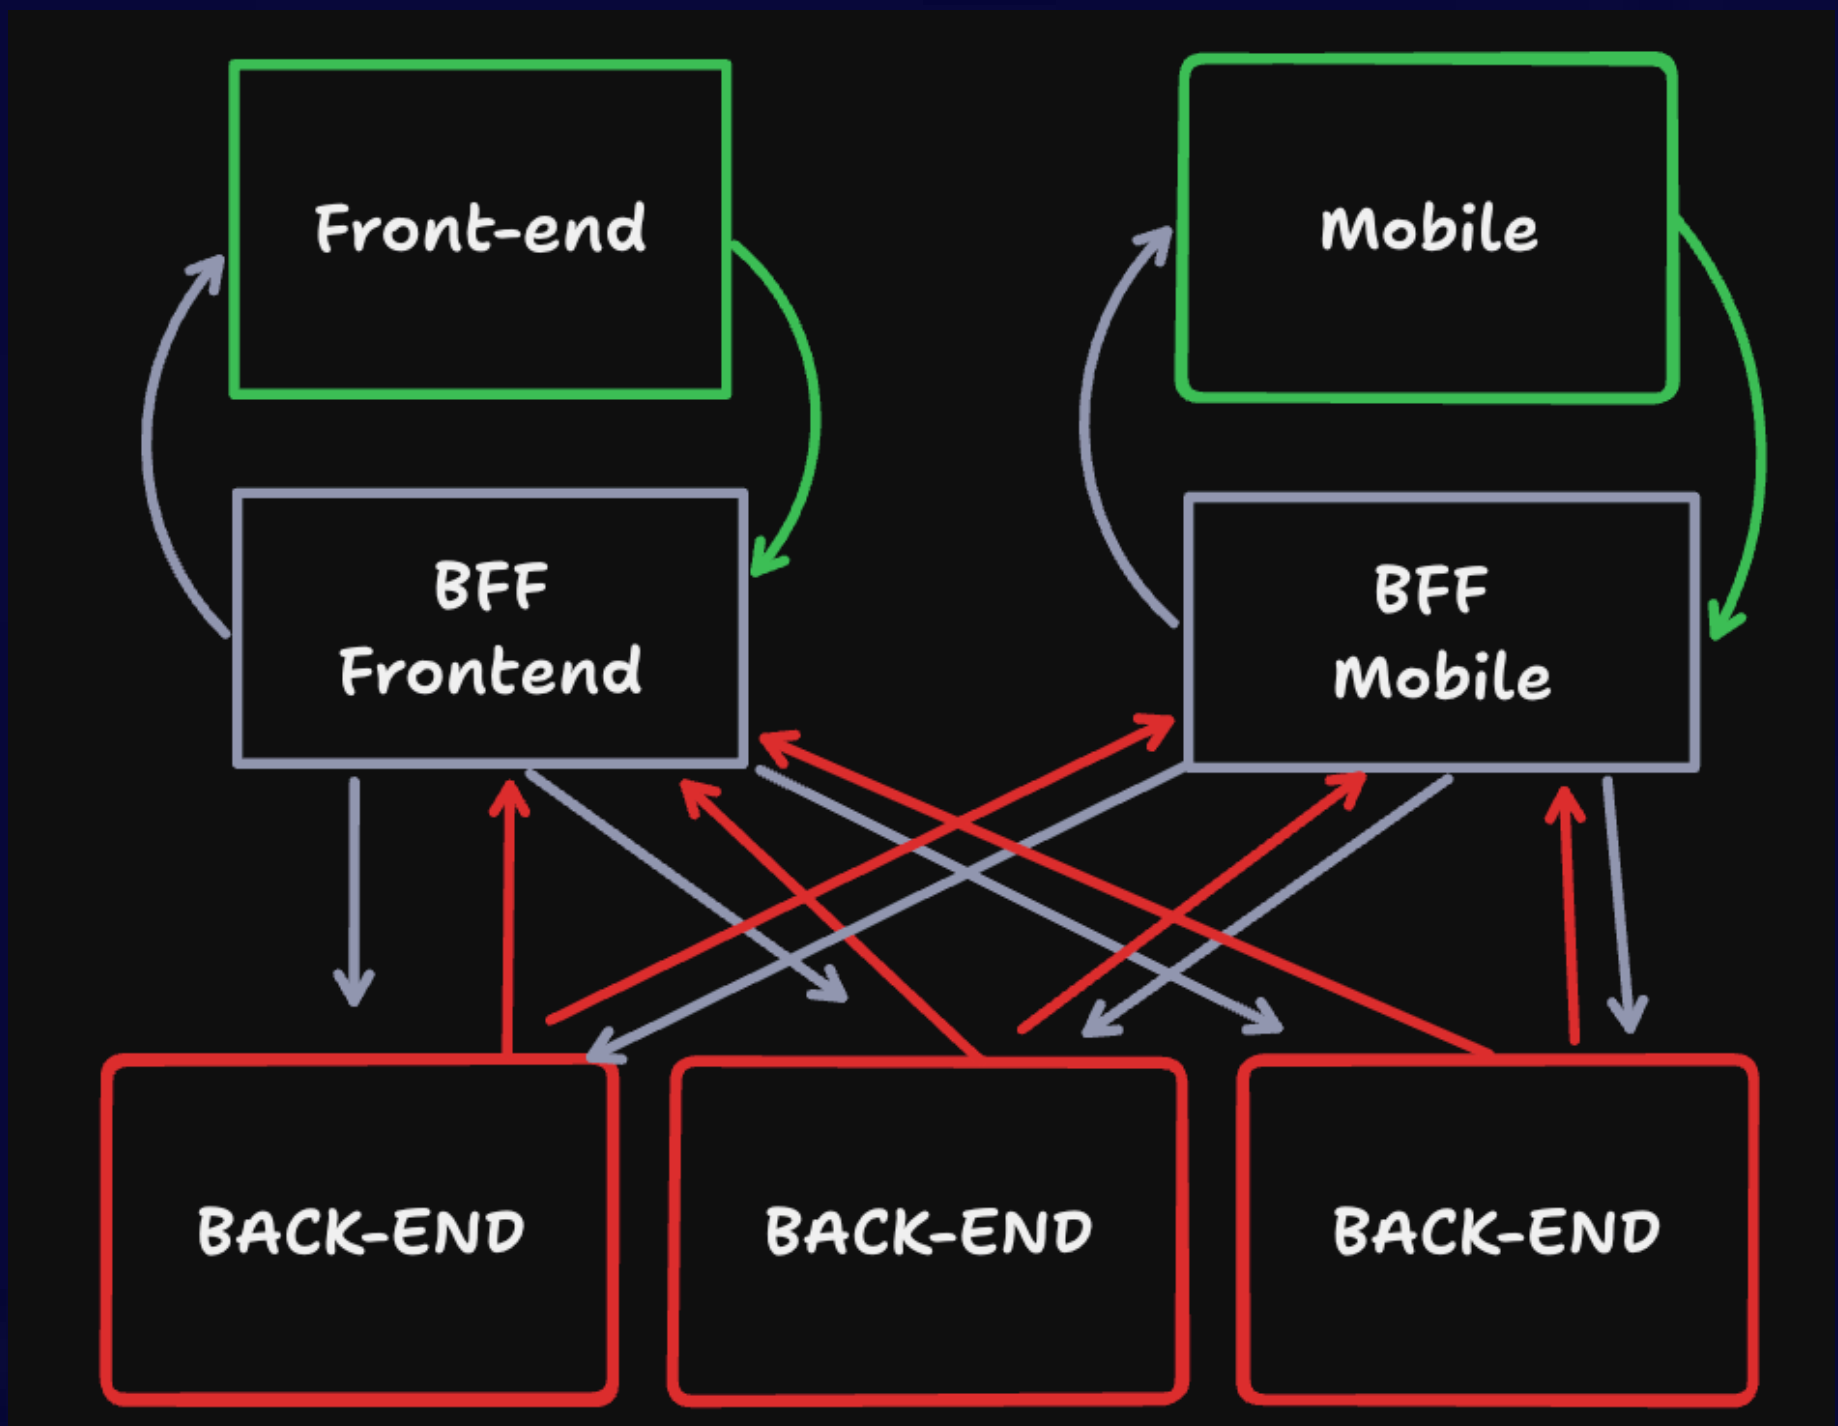

A ideia principal por trás do **BFF** é criar um **backend específico** para cada tipo de cliente (por exemplo, aplicativos móveis, web, etc.) em vez de um único backend genérico para todos os tipos de **clientes**.

Isaac Gomes

exemplo de como **Backend for Frontend** funciona

Isaac Gomes

Benefícios do **BFF**

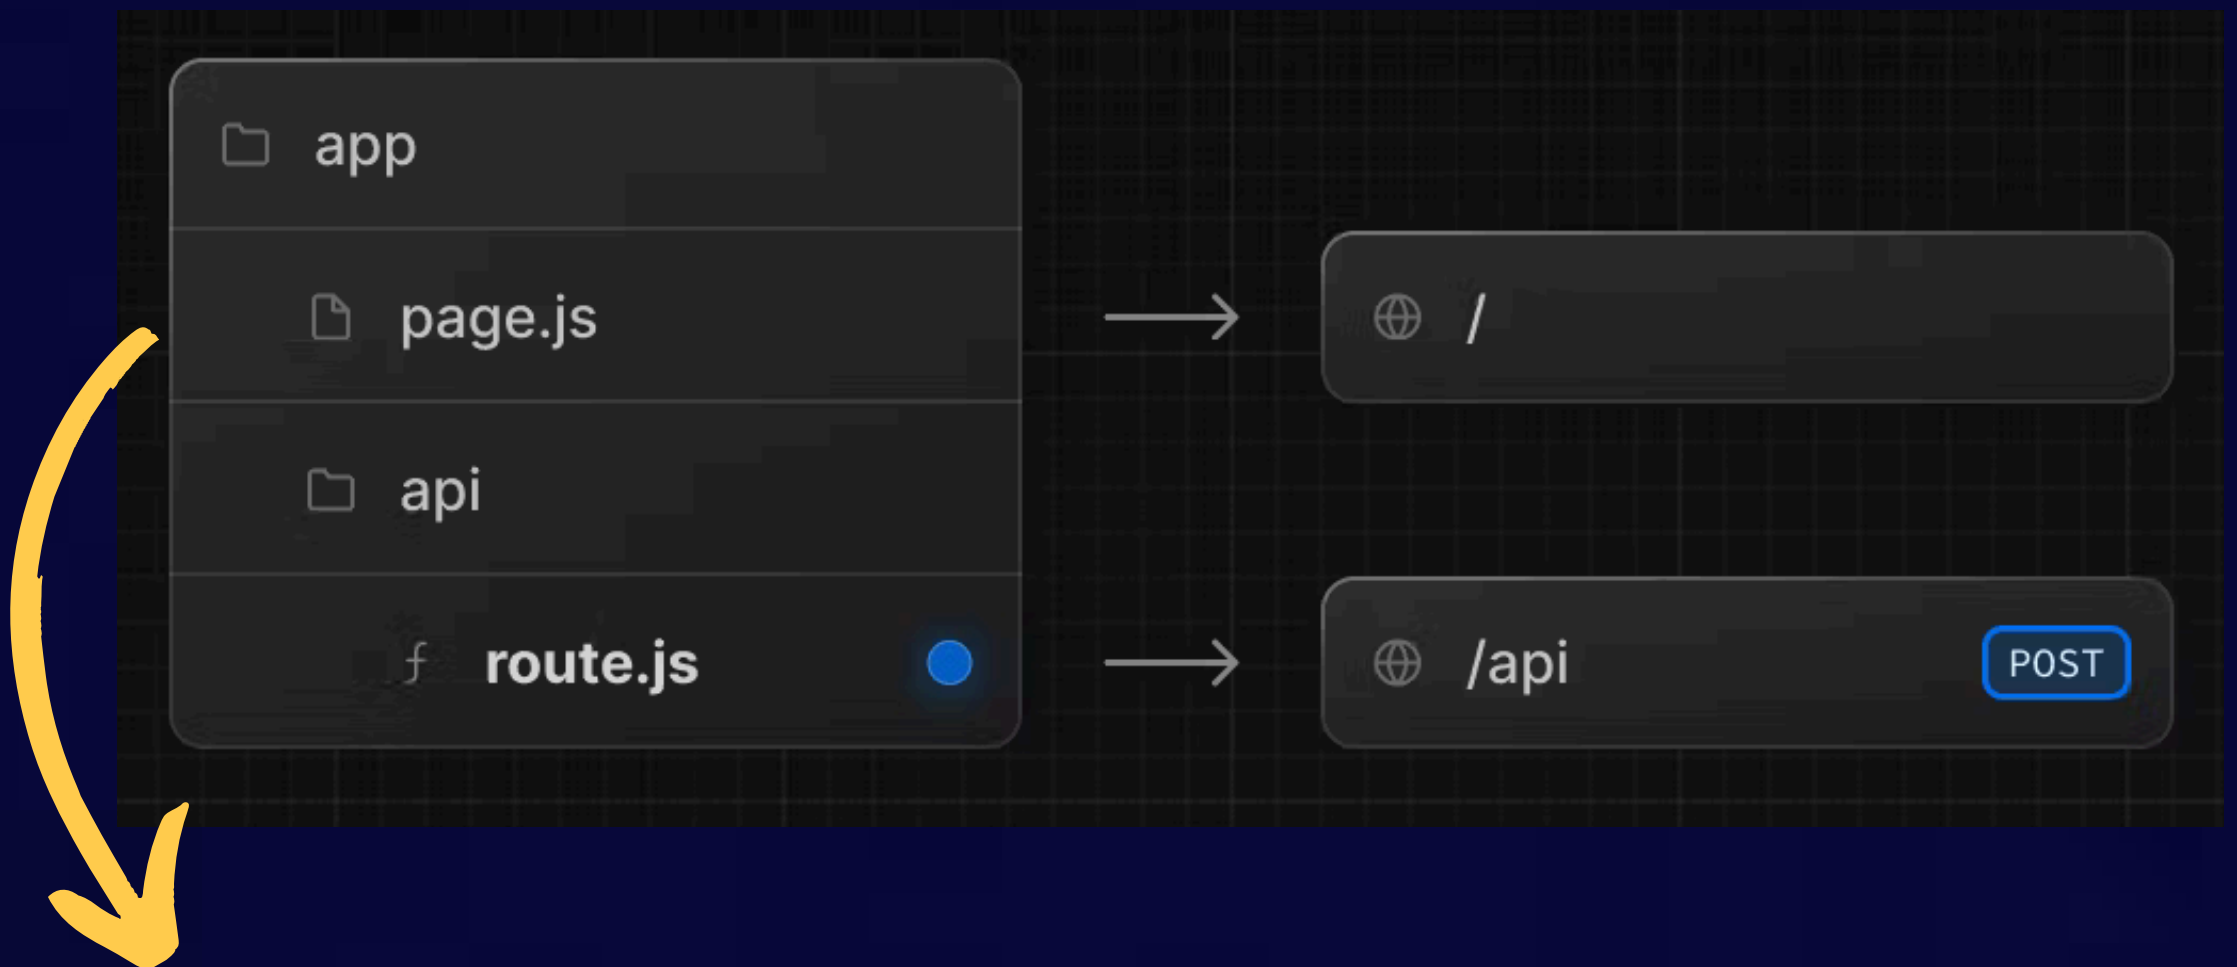

- **Customização**
- **Desempenho Otimizado**
- **Segurança**
- **Desacoplamento**

Isaac Gomes

Como Podemos Aplicar **BFF** em **Next.js** ???

Next.js é um Framework
Fullstack conseguimos
criar rotas **backend**
dentro da pasta **API**

Isaac Gomes

Onde acho informações sobre a criação de rotas na **API** ???

Route Handlers

Route Handlers allow you to create custom request handlers for a given route using the Web [Request](#) and [Response](#) APIs.

**basta pesquisar na
documentação por
Route Handlers**

Isaac Gomes

como criar um rota na **API** do **Next.js**

para criar um rota vc precisa
criar a pasta **API** dentro da
pasta **APP** e depois criar um
arquivo com o nome que
deseja e criar o file com o
nome **route**

Isaac Gomes

como criar um rota na **API** do **Next.js**

```
export async function GET(request: Request) {  
  return NextResponse.json(  
    'Hello World', {  
      status: 200,  
    })  
}
```

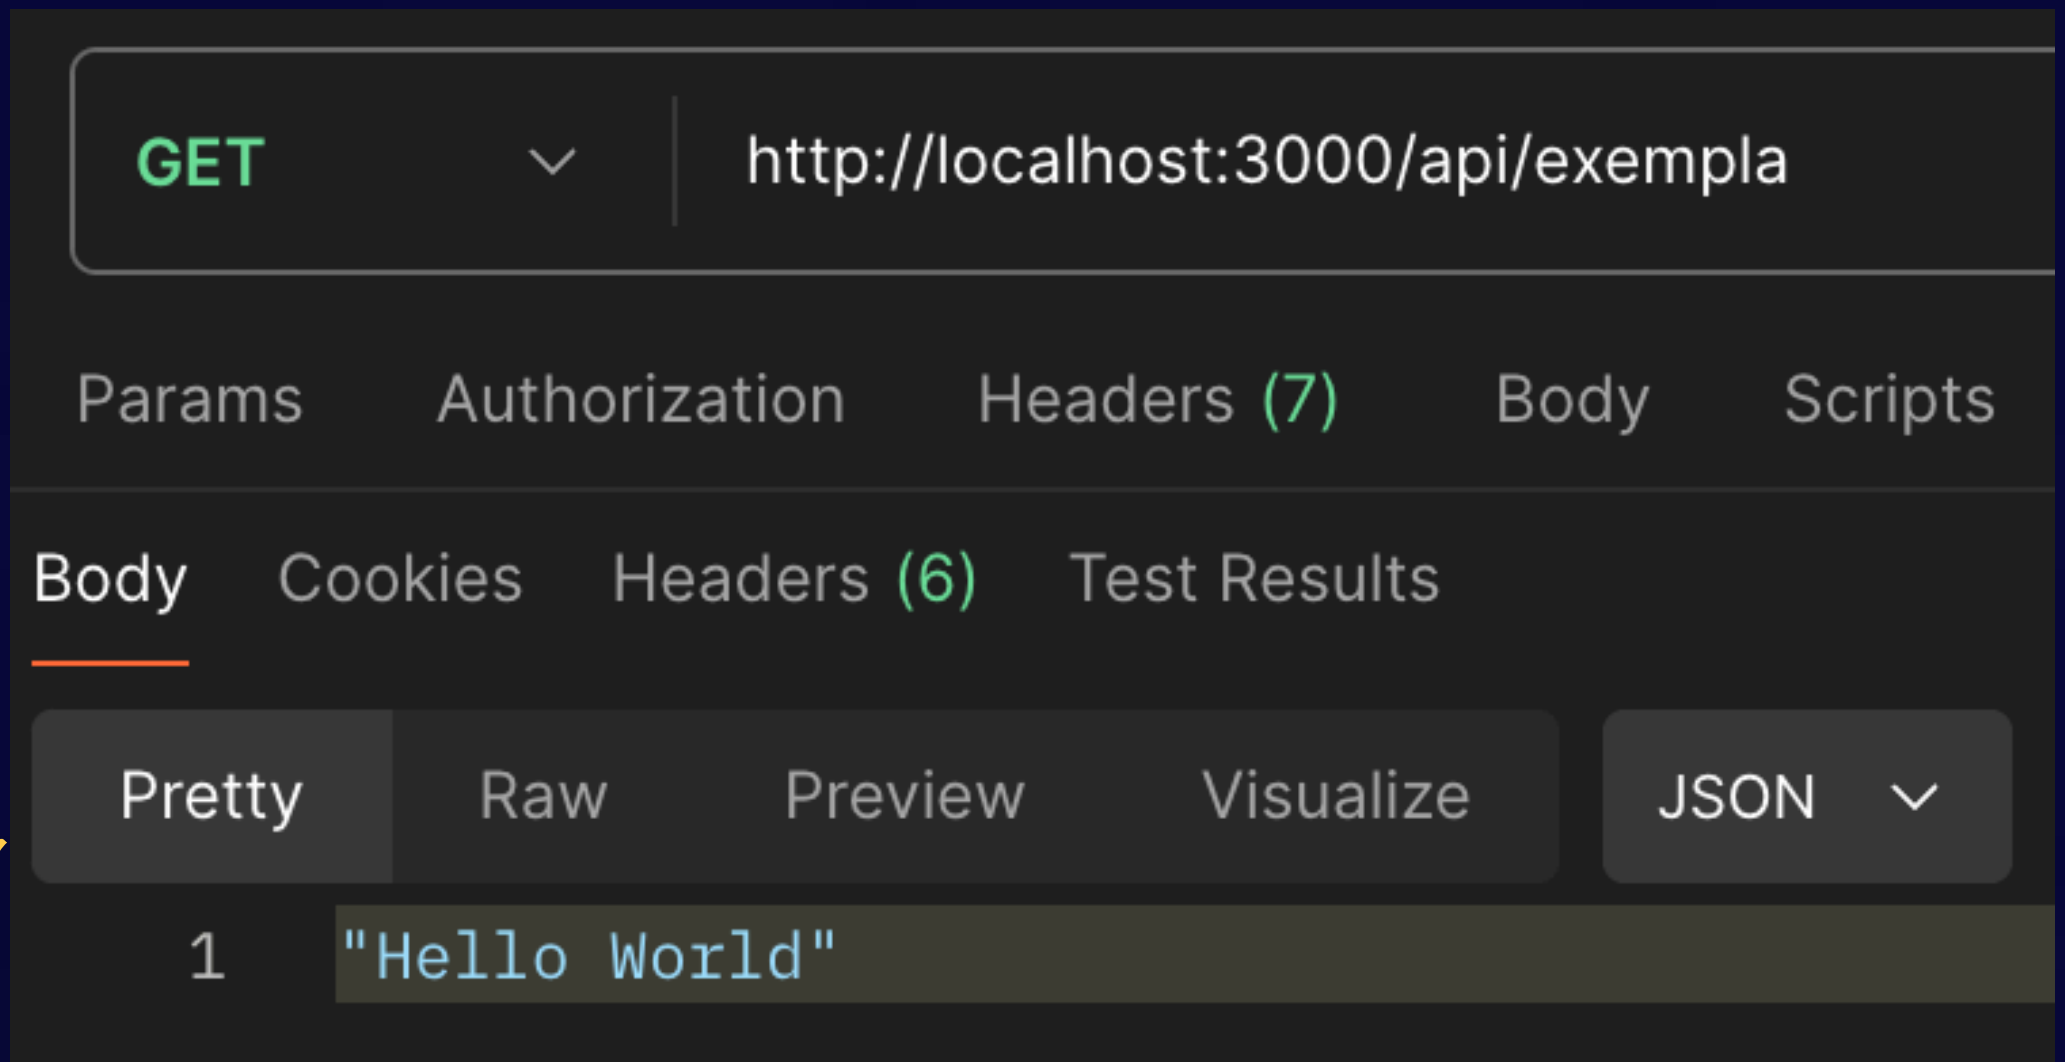

agora vamos criar a rota de
acesso no caso quero um **GET**
então para acessar basta
url/api/nome_do_arquivo no
type que definiu

Isaac Gomes

como criar um rota na **API** do **Next.js**

**agora basta acessar
sua rota**

Isaac Gomes

exemplo real de rota em **Next.js**

consumir um **endpoint** da
api do rick, um endpoint da
api do json placeholder e
realizar um **mapeamento**
dos dados para estruturas
que fazem sentido para
o client

Isaac Gomes

Consultando API

```
export async function GET(req: Request) {  
  try {  
    const [posts, characters] = await Promise.all([  
      fetchPosts(),  
      fetchRickAndMortyCharacters()  
    ])  
    return NextResponse.json(  
      adapterResponseGetPerson({  
        posts,  
        characters  
      }),  
      { status: 200 }  
    )  
  } catch (error) {  
    return NextResponse.json(  
      'fetching posts and characters',  
      { status: 404 }  
    )  
  }  
}
```

então aqui realizamos a consulta as duas API

Isaac Gomes

Adaptando a resposta

```
export async function GET(req: Request) {  
  try {  
    const [posts, characters] = await Promise.all([  
      fetchPosts(),  
      fetchRickAndMortyCharacters()  
    ])  
  
    return NextResponse.json(  
      adapterResponseGetPerson({  
        posts,  
        characters  
      }),  
      { status: 200 }  
    )  
  } catch (error) {  
    return NextResponse.json(  
      'fetching posts and characters',  
      { status: 404 }  
    )  
  }  
}
```

aqui mapeamos os dados e retornamos

Isaac Gomes

consultando a resposta

GET ⌵ http://localhost:3000/api/person

Params Authorization Headers (7) Body Scripts

Body Cookies Headers (6) Test Results

Pretty Raw Preview Visualize JSON ⌵

```
1 {
2   > "characters": [ ...
143 ],
144 > "posts": [ ...
645 ]
646 }
```

Isaac Gomes

Request para nosso Route Handler

```
export async function getPostsandCharacters(){  
  const { data } = await apiBFF.get('/person')  
  return data  
}  
  
export default async function Home() {  
  const data = await getPostsandCharacters()  
  return <main>TESTE</main>  
}
```

Isaac Gomes

Pronto estamos consumindo nossa rota

```
{
  characters: [
    {
      id: 1,
      name: 'Rick Sanchez',
      status: 'Alive',
      species: 'Human',
      type: ''
    },
    {
      id: 2,
      name: 'Morty Smith',
      status: 'Alive',
      species: 'Human',
      type: ''
    },
    {
      id: 3,
      name: 'Summer Smith',
      status: 'Alive',
      species: 'Human',
      type: ''
    },
  ]
}
```

Isaac Gomes

aqui vemos o fluxo na pratica

Isaac Gomes

como ficou a separação dos arquivos

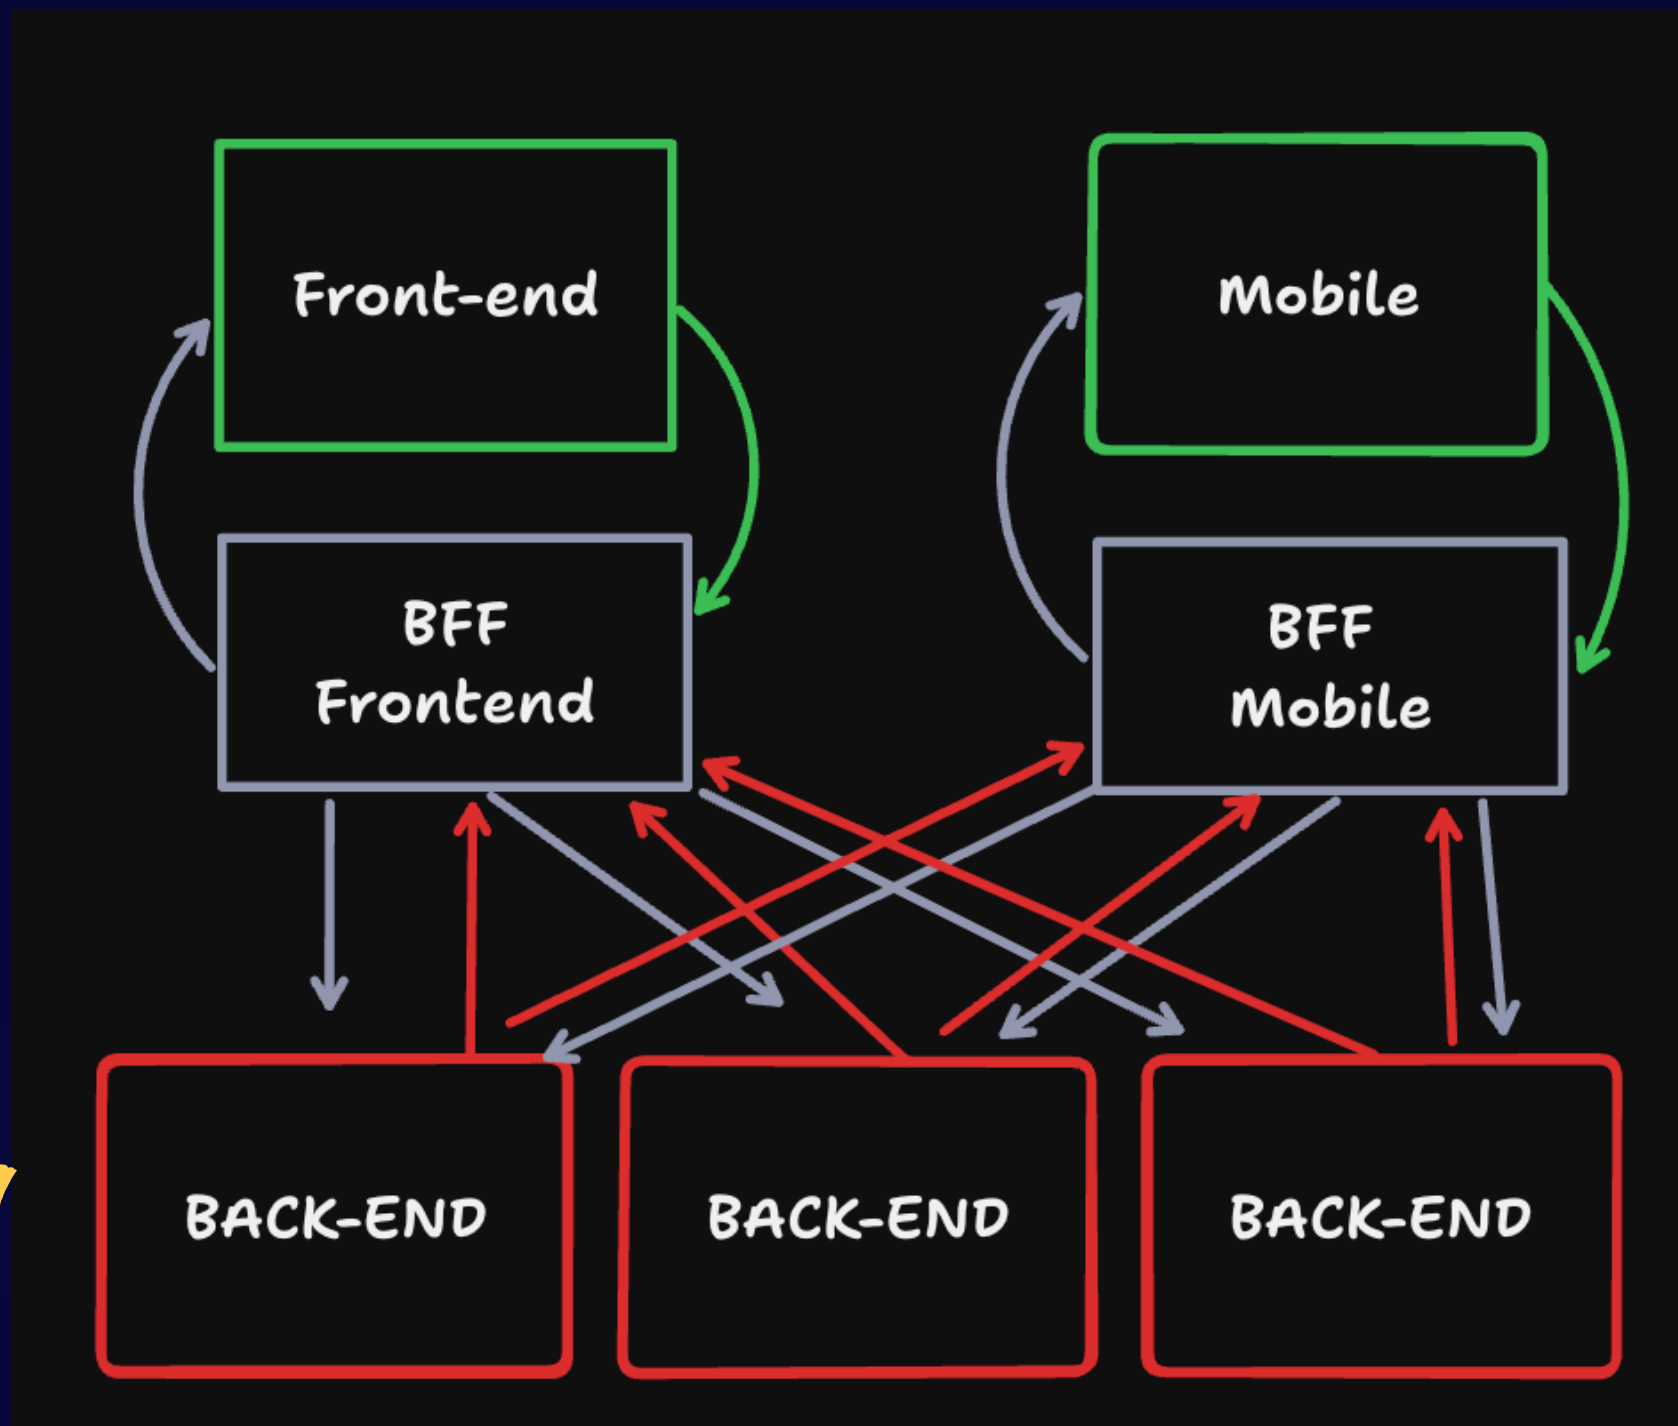

```

✓ src/app
  ✓ api/person
    ✓ adapter
      ResponseGetPerson.ts
    ✓ DTO
      CharacterDTO.ts
      PostDTO.ts
    ✓ interfaces
      Character.ts
      Post.ts
  ✓ service
    fetchPosts.ts
    fetchRickAndMortyCharacters.ts
    route.ts
  ★ favicon.ico
  globals.css
  layout.tsx
  page.tsx
```

Isaac Gomes

agora essa imagem
passa a ter mais
significado

Isaac Gomes
